BRAKE PADS **PASTILLAS DE FRENO**

By **CARBONE LORRAINE**

HIGH PERFORMANCE
SINTERED **BRAKEPADS**

LA TECNOLOGÍA METAL SINTERIZADO

Existen dos tipos de materiales para pastilla de moto: sinterizados y orgánicos. Solamente los materiales sinterizados pueden responder a las exigencias de una moto: potencia de frenado, calentamiento, reacción al frío, polvo, barro, agua...

Las pastillas de metal sinterizado (sintered en inglés), están fabricadas a partir de polvos. El producto de fricción contiene al menos 10 componentes distintos (cobre, bronce, hierro, cerámica, grafito...). Cada uno de ellos constituye un papel esencial en la fricción de la pastilla con el disco (comodidad, ruido, efectividad...)

Una vez mezclados dichos componentes, se consigue la mezcla metálica de fricción, la cual es comprimida en un molde obteniendo su forma final.

La pieza resultante es a continuación colocada sobre un soporte de cobre e introducida en un horno a 900 °C. Este es el denominado proceso de sinterización, es entonces cuando uno de los componentes metálicos de la mezcla se funde, consolidando el material y soldándolo al soporte.

Por último, la pastilla es rectificada, comprobada y envasada.

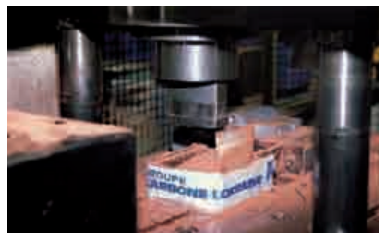

SINTERED METAL TECHNOLOGY

Two types of friction materials for motorcycle exist: Sintered and organics. Only sintered can meet all the demands of a motorcycle: powerful braking, overheating, braking in water, mud and sand, reaction in cold temperature.

Sintered metal brake pads are made from powders. The friction compound contains at least 10 constituents (copper, bronze, iron, ceramics, graphite...) each of these constituents has an essential part during the friction of the brake pad on the disc (comfort, noise, performance).

Once melted, these constituents form the friction mixing. This mixture is then compressed in a mould that gives the final shape

The resulting is then placed on its metallic copper colored back plate and put in a furnace at 900°C. This is the sintering process: one constituent of the compound melts strengthening the material and braze it on the support.

The Brake pad is then grinded, checked and packed.

LA TECHNOLOGIE METAL FRITTE

Il existe deux types de matériaux de friction pour moto : les matériaux frittés et les matériaux Organiques.

Seuls les matériaux frittés peuvent répondre à l'ensemble des sollicitations d'une moto : freinages puissants, échauffement, utilisation sous eau, poussière et boue, réactivité à froid.

Les plaquettes en métal fritté (sintered en anglais) sont fabriquées a partir de poudres. Le produit de friction contient au moins dix constituants (cuivre, bronze, fer, céramiques, graphites...). Chacun de ces constituants a un rôle essentiel au cours du frottement de la plaquette sur le disque (confort, bruit, performance)

Une fois mélangés, ces constituants forment le mélange de friction. Ce mélange est ensuite comprimé dans un outil qui lui donne sa forme finale.

La pièce obtenue est ensuite positionnée sur son support métallique cuivré puis introduite dans un four à 900°C. C'est le processus de frittage: un constituant du produit fond, consolide le matériau et le brase sur son support.

La plaquette est ensuite rectifiée, contrôlée puis emballée.
